

Availability problems

Dr Peadar Grant

October 9, 2022

1. Calculate the reliability, R , of a system at time $t = 20$ days assuming that it experiences 0.1 failures per day.
2. A system has 5 failures over the course of a year. Calculate the MTBF in days.
3. A system has an MTBF of 150 days. How many faults may be expected over the course of two years.
4. Calculate the inherent availability, A_i , of a system with a mean time between failure of 120 days and a mean time to repair of 12 hours.
